

The Growth Model Behind the Ask.

Five-year build, operator economics, and the market it opens.

PREPARED FOR FUNDING PARTNERS • AUGUST 2026

Most full-service senior living communities keep furnished guest suites. Between uses they sit dark. No occupancy report counts them and they earn nothing. The stays that do happen run on phone calls, a whiteboard, and a group text, and the quality depends on who was working that day.

Those suites are already built, most are already furnished, and all of them are already carried in operating expense. Where a suite is not furnished, or is furnished but never brought online, it is because no one has shown the community how. Revenue against that space is close to pure contribution. No capital expenditure, no new headcount, and no change to how a permanent unit is priced. SuiteBird turns it into a booking engine with published rates, live availability, collected payment, and a guest experience that runs the same way every time.

Then it counts them. Senior housing measures occupancy in move-ins and nothing else, so a suite that hosted twenty guest nights appears on the report in exactly the same place as one that sat dark all month. SuiteBird counts every guest night toward a blended occupancy figure. For the first time an executive director sees what a suite produced this month in nights, in revenue, and in prospects entering the pipeline.

The same system that fills a suite fills a building. A family books a weekend visit. A prospective resident stays a week, eats in the dining room, and meets the people they would be living beside. The community earns that relationship long before anyone is ready to decide, which is how a referral is owned years in advance rather than bought at the end from a network that charges thousands for a lead and never entered the building.

The demand is real, the inventory is real, and the rails were never built. Whoever builds them holds a position no referral company and no listing product can replicate.

01

What this is

The five-year revenue build behind the raise, stated in the metrics a proptech fund underwrites: revenue per community, value created per community, the market it enters, and why this founder.

02

Where it stands

Past concept. The SuiteBird platform, the operator dashboard, and the guest booking flow are live and demonstrable end to end. The production build is scoped at four months and is what Round 1 funds.

03

What it gives operators

A blended occupancy figure that counts guest nights, which the industry has never had, and NOI on furnished inventory that currently earns nothing. Lower acquisition cost is the third effect, not the first.

Five streams, five years.

Subscriptions, onboarding, Friends and Family stays, inter-community travel, and referral placement. Every price point is published and held flat across all five years.

\$2.56M

YEAR 3 REVENUE

\$8.82M

YEAR 5 REVENUE

1,477

COMMUNITIES AT YEAR 5

\$6,953

 REVENUE PER COMMUNITY,
Y5

Revenue stream	Year 1	Year 2	Year 3	Year 4	Year 5
Communities live, year end	100	342	665	1,061	1,477
Subscriptions	\$36K	\$159K	\$411K	\$787K	\$1.29M
Onboarding fees	\$15K	\$37K	\$52K	\$67K	\$74K
Friends and Family stays	\$72K	\$350K	\$870K	\$1.74M	\$2.92M
Inter-community travel	\$18K	\$181K	\$471K	\$909K	\$1.48M
Referral placements	\$38K	\$199K	\$755K	\$1.68M	\$3.05M
Total revenue	\$178K	\$926K	\$2.56M	\$5.19M	\$8.82M

Model construction. Revenue is calculated on average live communities through each year, not on year-end count, so no revenue is credited to a community before it is onboarded. Annual community churn of 8% is deducted from the base every year. Price points are fixed across all five years at \$1,500 per placement, \$149 onboarding, \$24 net per Friends and Family booking, and \$19.50 net per travel booking. Subscription is the only figure that moves, and it moves on tier mix rather than on any increase to a published price.

How it makes money.

Five streams, every price published, every price fixed for five years. Four of them are hospitality revenue. The fifth is earned only on a signed lease.

01 Subscription, per community

Starter \$49 · Growth \$79 · Enterprise \$295 per month

Recurring monthly revenue with every feature included from day one. Simple published tiers, no feature gating, no annual escalator. The model carries a \$60 blended rate, which assumes most communities sit at the Starter end of the sheet.

02 Onboarding

\$149 one time at signup

Covers platform setup, data migration, and training. Collected before the first subscription month, so every new community is cash positive on arrival.

03 Friends and Family stays

\$15 flat plus 3% of the stay

Families book overnight stays in the community's furnished suites. The operator sets the rate and approves every guest. At a \$100 nightly rate over two nights, SuiteBird nets roughly \$24 and the operator keeps the remaining \$176. Zero marginal cost to the community, because the suite was already standing empty.

04 Inter-community travel

\$15 flat plus 3%, from Month 6

Residents book stays at partner communities the way a guest books a different property in a hotel group. At a \$75 nightly rate over two nights, SuiteBird nets roughly \$19.50. Every community that joins increases the value of the network to every other community.

05 Referral placement

Flat \$1,500 at move-in

Charged to the community only when a trial stay converts to a signed lease. Zero cost to the family. Earned rather than purchased, and it is the only stream in the model that is not paid on a recurring or per-transaction basis.

Why the order matters. The first four streams are hospitality revenue and they are what a community buys. They carry no risk to the operator, require no change to how a unit is priced, and start producing the month the platform goes live. Placement is what a community earns its way into after the stays are already running, and it is the reason the model compounds rather than plateaus.

What the operator gets.

Two things the industry has never had: a revenue line on furnished inventory, and an occupancy number that counts it.

A new occupancy metric

Micro-occupancy

Senior housing counts occupancy in move-ins and nothing else. A furnished suite that hosted guests twenty nights in a month appears in exactly the same place on the report as one that sat dark all month, which is to say nowhere. SuiteBird counts every guest night toward a blended occupancy figure, so an executive director sees for the first time what a suite produced this month in nights, in revenue, and in prospects entering the pipeline.

The same record becomes first-party guest data the operator owns outright, which no referral platform can hand them.

A new NOI line

On inventory already owned

Guest suites are already built, mostly already furnished, and already carried in operating expense. Revenue against them is close to pure contribution. There is no capital expenditure, no new headcount, and no change to how a permanent unit is priced. Filling a vacant unit even a single month earlier is worth roughly \$4,800 at typical independent living rents, and that is before the acquisition cost of that resident falls.

Per community, per year	Year 1	Year 2	Year 3	Year 4	Year 5
Stay and travel revenue to operator	\$12,909	\$17,097	\$18,936	\$21,831	\$24,726
Placement savings versus market rate	\$1,500	\$1,800	\$3,000	\$3,900	\$4,800
Total operator benefit	\$14,409	\$18,897	\$21,936	\$25,731	\$29,526
Paid to SuiteBird	\$3,559	\$4,192	\$5,084	\$6,009	\$6,953
Benefit per dollar paid	4.0x	4.5x	4.3x	4.3x	4.2x

The alignment is structural. The transaction fee on a stay is \$15 plus 3%, so the operator retains roughly 88% of stay value. SuiteBird is not a marketplace taking rent from the middle. It is infrastructure the operator runs under their own brand, at their own rates, with their own approval on every guest. That is why a community adopts it, and it is why they do not leave.

A \$1.0B market, moving.

Senior living operators spend roughly \$1.0B a year buying move-ins from third-party referral networks. That spend is under active pressure, and it is the pool SuiteBird redirects.

\$1.0B

ANNUAL REFERRAL SPEND

222,000

PLACEMENTS PURCHASED

\$667M

RETURNED TO OPERATORS
AT \$1,500

0.3%

SHARE REQUIRED AT YEAR
5

Why the spend moves

The pressure is already there

Operators pay \$3,000 to \$6,000 for a prospect sourced by someone who has never entered the building, then lose the relationship and the data to the platform that sold it to them. Two of the largest operators publicly exited third-party referrals in 2025. The exit is not theoretical, but the operators leaving have nothing purpose-built to move to, which is the opening.

Why it moves to a flat fee

At \$1,500, SuiteBird returns \$3,000 per placement to the operator and roughly \$667M annually if the category converts. The economics do not require the operator to believe anything about software. They require arithmetic on a line item they already carry.

What the plan actually needs

Year 5 placement revenue is \$3.05M, which is 0.3% of the \$1.0B pool and roughly 0.9% of the placements bought through it each year. The growth case does not depend on category disruption. It depends on a rounding error of an existing budget.

The compounding effect. Placement is the entry point, not the destination. Each placement is preceded by a stay, and each stay produces first-party guest data, a measurable occupancy figure, and a relationship the operator owns. The referral market funds the acquisition of the operator. The platform is what retains them.

The rails agents will need.

Moving a parent into senior housing is one of the most stressful logistics problems a family ever faces. It is exactly the problem agents are about to take over, and there is nothing for them to book.

The transition is an agentic workload

Consumer side

A family managing a parent's transition is coordinating tours across six communities, comparing care levels and pricing structures, aligning a hospital discharge date, scheduling a move, and doing all of it while working full time and often from another state. Today that coordination is outsourced to a referral agent whose compensation depends on where the parent lands. An assistant that plans, compares, schedules, and books on the family's behalf removes both the burden and the conflict. That assistant is arriving whether or not this industry is ready.

Adult children between 45 and 65 are making these decisions, and they already delegate travel, scheduling, and research to agents.

Agents cannot book what is not bookable

Where SuiteBird sits

Agentic commerce requires structured supply: live availability, published rates, a payment path, and a confirmation. Senior housing has none of it. Short stays run on phone calls and a whiteboard, and no industry body tracks the category, so there is no inventory layer for an agent to reach. SuiteBird is building that layer for its own booking engine, which means it is also the substrate any future agent has to route through. Supply-side rails are the durable position in agentic commerce, because the assistant is a commodity and the inventory is not.

The data no referral network can assemble

Compounding asset

A trial stay produces behavioral signal a lead form cannot approach: which community a prospect chose, how long they stayed, what they engaged with, and whether they converted. Across a network that record becomes the training substrate for matching a family to the right community on fit rather than on who paid for placement. Every stay improves it, and it accrues to the operator and the network rather than to an intermediary.

Operator-side agents, already scoped. The same structured inventory supports dynamic rate setting against local hotel comps, automated make-ready scheduling between guests, guest-to-community matching, and a pipeline assistant that tells a sales director which trial guest to call today and why. None of this is possible in an industry that cannot see its own inventory. All of it becomes routine once it can.

Why this founder.

This is a business that is difficult to see from outside the industry and obvious from inside it. The idea came from eight years of watching the same inventory sit empty.

Eight years inside senior housing hospitality

Domain insider

The guest suite problem is not visible in market data. It is visible when you have stood in a community and watched a family ask whether their mother can stay the night, watched a director say yes and then handle the booking on a sticky note, and watched the same suite sit empty for the next three weeks while the building carried the cost. Nobody builds this from a spreadsheet. The specific mechanics of how communities actually operate short stays, who approves them, what the staff can realistically execute, and what an executive director will and will not adopt, are the parts that determine whether the product works, and they are learned in buildings rather than in research.

Built before funded

Zero to one, already underway

The beta platform is live and demonstrates the full product end to end: operator dashboard, booking flow, guest experience, and analytics layer. Alongside it, two adjacent businesses are already structured on the same infrastructure, the go-to-market model is built, the market sizing is built, and the legal structure of the placement fee has been mapped state by state. None of that required outside capital. It required knowing exactly what to build.

The relationships are the distribution

Where the first customers come from

Senior living is a relationship industry with a small number of decision makers per operator group, and cold outbound converts poorly. Eight years produces a network of operators, directors, and industry groups who take the call. That is why the go-to-market plan is built around proving the model one community at a time and then expanding through the operator, rather than around paid acquisition.

What the capital actually funds. Not discovery. The product question is answered, the market question is answered, and the customer relationships exist. What \$350K buys is engineering time to move from beta to production, the multi-state legal work that makes the placement fee collectible, and the runway to convert existing relationships into the first signed portfolio.

Built to be conservative.

The projections assume no category shift, no price increases, and no full utilization of any asset. Six constraints are built into the model rather than argued around it.

- 01 Churn is deducted every year.** 8% of the community base is removed annually before any growth is added. The model never assumes a community stays forever.
- 02 Revenue is counted on average live communities.** Not on year-end count. A community signed in month eleven contributes one month of revenue, not twelve.
- 03 Placement intensity stays near one move-in per community.** A typical community fills roughly 26 units a year. At Year 5 the model sources 1.6 of them, or 6% of the community's annual move-ins.
- 04 Suites are never assumed full.** Year 5 assumes 8 bookings per community per month across two suites, which is roughly 27% suite utilization. The remaining 73% is upside the model does not claim.
- 05 Prices never rise.** The placement fee, onboarding fee, and both transaction fees are fixed for five years. Subscription moves only on mix shift toward existing published tiers.
- 06 Capital releases against verified milestones.** No tranche deploys until the prior milestone is independently confirmed, which caps downside at the tranche rather than the round.

What this produces. \$8.82M of Year 5 revenue on 1,477 communities, with 15% recurring subscription, a fixed price sheet, and less than 0.3% of the referral pool. Every figure above is a floor rather than a target.

Tier pricing

Blended subscription sits at the Starter end of a published sheet that runs to \$295. Mix shift alone is multiples of the modeled figure.

Suite utilization

73% of available suite nights go unbooked in the model. Each point of utilization carries stay revenue, travel revenue, and placement pipeline together.

The second market

RespiteSuites runs the same platform against short-term respite and hospital discharge, a broader payer mix on the same inventory. It is not in these numbers.

The inventory behind it.

Two pools of unused space define the opportunity. Both already exist, both are already paid for, and neither is counted by any occupancy report the industry publishes.

The first pool is permanent inventory standing empty. NIC MAP reported 637,000 occupied senior housing units across its 31 Primary Markets in the first quarter of 2026 at an occupancy rate of 89.5%, which implies roughly 712,000 units of tracked inventory and about 74,700 of them unoccupied. Independent living runs tighter than the sector at 91.1% occupancy, and on a 48% independent living share of primary market inventory that segment alone carries roughly 30,400 vacant units inside the Primary Markets. Extended across the national supply, the estimate lands between 70,000 and 90,000 vacant independent living units at any given time. Every one of those units represents a resident who has not yet chosen a community, and the industry's only mechanism for reaching them is a lead form.

The second pool is temporary inventory nobody measures. Across roughly 30,300 full-service communities in the United States, Canada, and the United Kingdom, at two furnished guest suites each and an 80% adoption assumption, approximately 48,480 suites are rentable. At a 55% utilization assumption, about 21,800 of them sit empty on an average night, which is close to 8.0M idle suite nights a year. That inventory carries no incremental cost to the operator, appears on no occupancy report, and currently produces nothing. It is also the same physical inventory that serves both Friends and Family demand and short-term respite demand, which means utilization can rise substantially without a single new unit being built. SuiteBird converts the second pool into the acquisition channel for the first.

How to read these numbers. Occupancy and occupied-unit figures are NIC MAP first quarter 2026 data for the 31 Primary Markets. The independent living share of primary market inventory, the national extension, and the guest suite counts are directional estimates for discussion rather than audited data, and the suite figures assume two suites per community at 80% adoption. Skilled nursing and care homes are excluded throughout and would materially increase both pools.

What the capital buys.

\$350K across three milestone-triggered SAFE rounds over 18 months. Each tranche retires a specific risk before the next is released.

Round 1 • \$60K

Build the platform

The beta is live and demonstrates the product end to end. Round 1 funds the production build, scoped at four months, plus brand and site. Product risk closes first and closes fast.

Round 2 • \$140K

Clear the fee to collect

Multi-state legal opinion on the placement structure across the RCFE, ALF, and equivalent regimes, plus C-suite outreach. The referral fee regulations differ by state, and clearing them before the first dollar is collected converts the compliance work into a barrier that a later entrant has to repeat.

Round 3 • \$150K

Prove the portfolio motion

Paid operators and revenue traction. The measure is the first signed portfolio rather than logo count, because communities are acquired in groups through the operator, not one building at a time.

What we are looking for in a partner. Capital is the smaller half of this. The platform is sold to owners and operators, so the introduction path into groups actively acquiring communities is worth more at this stage than the check. Beyond that, three things: operating knowledge of how senior housing or hospitality real estate actually runs, patience with a relationship-led go-to-market that will look slow before it compounds, and a candid read on where the model is still too thin. The structure above is how this has been framed to date rather than a condition. Preferred equity in a single round is workable, and the milestones hold either way as the operating plan.

Terms. Pre-money SAFE notes on YC standard paper. Milestone-triggered conversion at the next qualified financing. MFN on Round 1. Pro-rata rights through Series A. No debt, no interest, no maturity date, no board seats. Full templates, cap table pro forma, and conversion scenarios available on request.

Two adjacent businesses.

Both run on infrastructure SuiteBird has already built. Neither is included anywhere in the revenue model in this document.

SuiteInnovations

The furnishing arm

SuiteInnovations removes the single most common objection SuiteBird encounters, which is that a community has no furnished suite to activate. It is a direct-ship furnished suite catalog built for operators rather than designers or procurement teams, modeled on the hotel FF and E industry brought downstream to senior living. Packages run from Essential at \$1,800 to \$3,800 through Premium at \$4,200 to \$7,500, shipped free with assembly guides so the community's own maintenance team completes the install, with managed installation available as an upgrade. Three buyers use it: operators furnishing guest, respite, model, and short-term rental units; residents and families furnishing a home at move-in; and community staff referring those residents through a free partner portal that earns referral credit. Every suite furnished becomes a SuiteBird-activatable revenue asset, which makes it both a margin business and the on-ramp to platform adoption.

RespiteSuites

The second market

RespiteSuites is the same platform configured for a different market. Short-term respite and post-acute recovery stays are marketed by nearly every major operator and bookable almost nowhere, and no national booking platform exists, only outdated directories and lead-form referral models. RespiteSuites is consumer-first, built for the family caregiver, with an operator section that publishes its vetting criteria as a trust signal. It carries its own revenue structure: a 3% booking processing fee on stay value, subscription tiers at \$79, \$149, and \$249 per month, and premium listing placement. Intake is handled as a conduit, collecting and packaging data for the host community rather than holding it, under HIPAA infrastructure and Business Associate Agreements. The host community holds the care license and payer enrollment, which keeps RespiteSuites clear of licensure while opening Medicare hospice respite, the GUIDE dementia model, and VA rails.

Why they are here. Both businesses share SuiteBird's inventory, its operator relationships, and its codebase. SuiteInnovations creates the asset the platform runs on. RespiteSuites monetizes that same asset against a second demand source with a broader payer mix. Neither requires new infrastructure, and neither appears in any figure in this document.
